## 1 How to Read this Document

This document details the energy calibration results for GMn over all kinematics. This set considers the ADC gain parameters obtained from SBS8 (all available data of integrity) applied to the last third of SBS4 (after 2021-10-24 04:30:00) and all remaining GMn data. This constitutes the second high voltage set of two for HCal during GMn. For information regarding the calibration process, see the [overleaf](#).

Each of the sections contains a brief description of the calibration results that follow. Any and all questions/concerns regarding these plots should be directed to the author at the email provided.

## 2 Special Considerations

- This calibration results from analysis of LH2 data exclusively.
- As a matter of record, this second set differs from the first (prior to 2021-10-24 04:30:00) in order to address a set of low signal channels whose cause, at the time of this report, is not fully understood. In order to separate signal from pedestal, several channels saw HV increase and in order to reduce the rate of saturation, a few channels saw HV reduction. See the [GMn HCal Settings](#) record for details.
- While better cluster selection is possible with various methods which can improve these calibrations, only the primary cluster information has been used for calibrations on this pass. This choice is due to the lack of individual block information included in the data for clusters beyond the primary which would be needed to verify the quality of calibrations. Data volume constraints permitting, it is recommended that all HCal cluster information be included for future passes.
- The final section, **Supplemental**, gives a list of elastic cuts and experimental parameters for each of the four 48D48 magnetic field settings employed during SBS8. Where the adc time  $\sigma$  is specified, the cut for this calibration is set to  $6\sigma$  pending future passes where a coincidence time between HCal and BCal will provide better elastic selection.

This section also contains a copy of the database file db\_sbs.hcal.dat for record.

## 2.a Number of Events Available for Calibration

Number of available SBS8 events per HCal channel after elastic cuts.

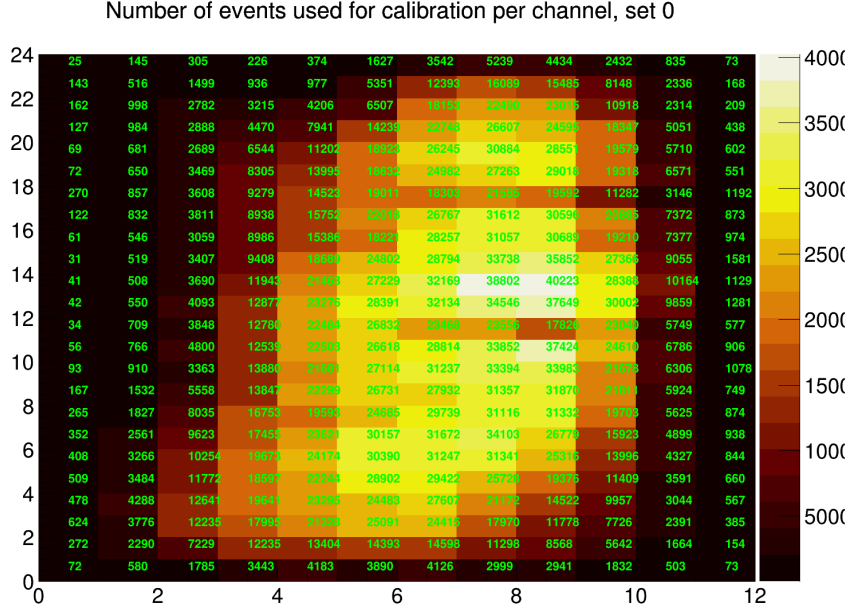

Figure 1: HCal row vs col, total number of elastic events used

## 2.b MC / Data Comparison, Sampling Fraction

HCal sampling fraction over all channels, primary block. Data and monte carlo comparison.

2.b.1 SBS4, Post 2021-10-24 04:30:00

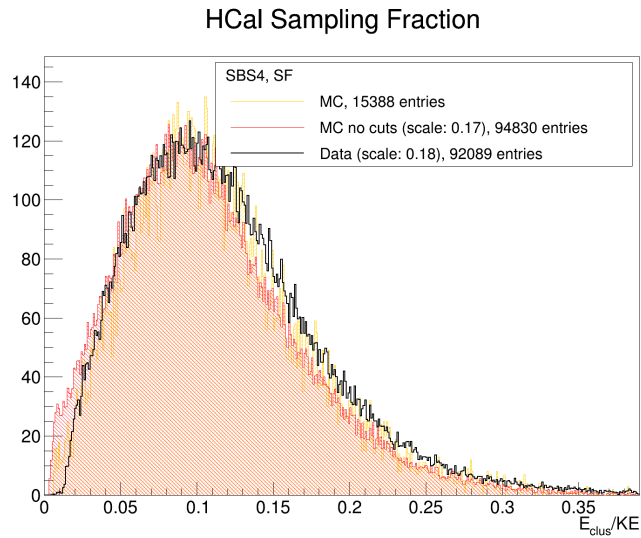

Figure 2: HCal Sampling Fraction, Data/MC Comparison

2.b.2 SBS7

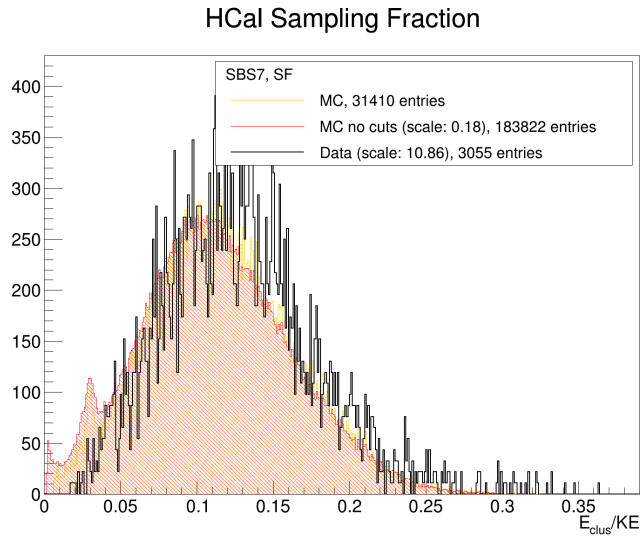

Figure 3: HCal Sampling Fraction, Data/MC Comparison

### 2.e.5 SBS8

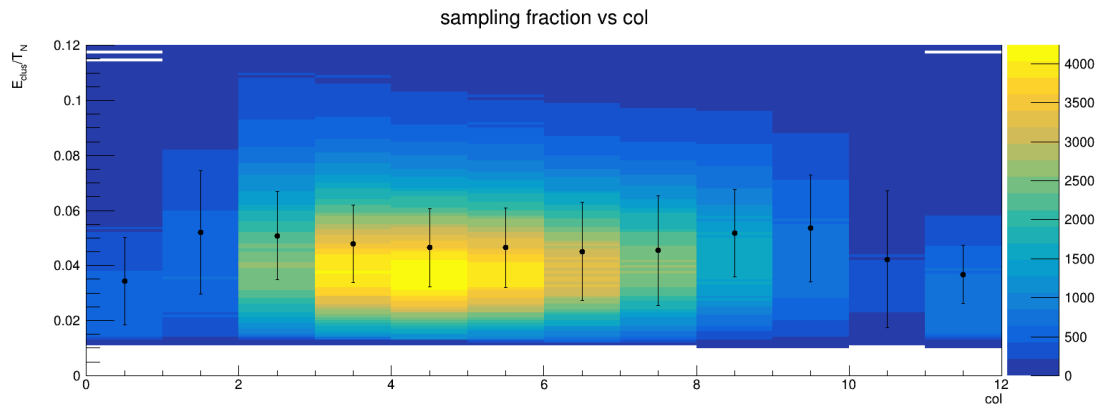

Figure 24: HCal Sampling Fraction vs Col, After Calibration

### 2.e.6 SBS9

Figure 25: HCal Sampling Fraction vs Col, After Calibration

## 2.f Run to Run Comparisons

HCal energy spectrum as a function of run number. LH2 and LD2 runs are color-coded for convenience.

Note that the lack of available statistics for SBS7 and SBS11 render these plots of dubious value on these kinematics.

### 2.f.1 SBS4
